

Type Conversion

Converting one data type into another data type is called *Type Conversion*.

Type of *Type Conversion*:-

- Implicit Type Conversion
- Explicit Type Conversion

Implicit Type Conversion

In the Implicit type conversion, python automatically converts one data type into another data type.

Ex:-

```
a = 5
```

```
b = 2
```

```
value = a / b
```

```
print(value)
```

```
print(type(value))
```

Explicit Type Conversion

In the Cast/Explicit Type Conversion, Programmer converts one data type into another data type.

- `int (n)`
- `float (n)`
- `complex (n)`
- `complex (x, y)` where x is real part and y is imaginary part
- `str (n)`
- `list(n)`
- `tuple(n)`
- `bin (n)`
- `oct (n)`
- `hex (n )`
