

Math Module

It is a module that contains several functions to perform mathematical operation.

If we want to use this module then we have to import it first.

`from math import *`

Math Functions

- `floor(n)` – Decrease `n` value to the previous integer value . If `n` is integer, then same value is returned.
- `ceil(n)` – Raise `n` value to the next higher integer. If `n` is integer, then same value is returned.
- `fabs(n)` – Returns absolute value or positive quantity of `n`
- `factorial(n)` – Returns factorial value of `n`
- `sqrt(n)` – Returns positive square root of `n`
- `pow(n,m)` – Returns `n` value to the power of `m`

Math Functions

- $\sin(n)$ – Returns the sine of n
- $\cos(n)$ – Returns the cosine of n
- $\tan(n)$ – Returns the tangent of n
- $\gcd(n, m)$ - Return the greatest common divisor of the integers a and b . If either a or b is nonzero, then the value of $\gcd(a, b)$ is the largest positive integer that divides both a and b . $\gcd(0, 0)$ returns 0.
